

Vehicle Access and Damage Control for just a few vehicles!

Are you responsible for Health & Safety?

Do you have a small industrial fleet or a very large fleet across many sites?

Can pedestrians access your materials handling areas?

Are you concerned about costly accidents in the workplace?

Is damage to vehicles and assets already costing you money?

Thought about installing a simple to manage vehicle control system?

'Sites with few vehicles do not always need a complete reporting system, but they do need a robust means of preventing unlicensed operators enabling equipment'

Did you know damage accounts for an average of 40% of all annual fleet maintenance bills?

Did you also know that over 30% of fatalities caused by goods vehicles involve a fork lift truck, and that up to 30% of those occur in warehouse storage areas and 30% in loading bays?

ACCESS CONTROL PLUS+ is the easy to manage, simple to use and most cost-effective solution to controlling the operation of either a small industrial fleet or a very large fleet across many sites.

It combines Smart Card driver access control and shock sensing to aid site safety improvements and damage cost reduction - ideal for sites where full reporting software is not necessary.

Driver event logs, including information such as Driver ID, Utilisation, Truck Type and Shock can all be viewed on the access modules LCD display upon demand by pressing either the red or green button. The logged data can then be used as valuable evidence to aid the investigation of any incident that either has, or could have caused some kind of loss to an organisation or its employees, thereby improving overall Health & Safety practice.

How the System Works

Only drivers holding a relevant drivers licence for designated vehicles should be issued with an ACCESS CONTROL PLUS+ Smart Card (electronic drivers licence) to operate vehicles.

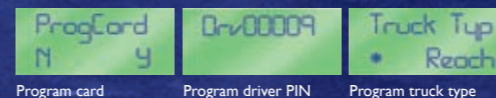

Once a vehicle is logged on, the drivers log on time, utilisation percentage, and any date & times of shocks* will be saved and available to view on the LCD for later investigation.

*Note: Shock sensing is fitted as standard with this system, although this is not always the most appropriate option for larger vehicles, in which case, it is advisable to request this feature to be disabled.

Programming Driver Smart Cards

No PCs, peripherals or software are needed to operate this system, making it easy to manage and simple to use. All drivers licences can be programmed with a PIN and licensed truck type(s) by a designated supervisor on any vehicle fitted with an ACCESS CONTROL PLUS+ module.

Sample screens:

Program card Program driver PIN Program truck type

Viewing Information

No Smart Card is required to actually view the logged information. Site supervisors and engineers can view the most recent 40 event logs on demand by simply pressing the green button.

Sample screens:

View driver PIN & logged on time View shock menu View driver utilisation

Do You Already Use Smart Cards to Control Building Access and Cashless Vending?

Why not use the same card to control access to your vehicles? Our electronic drivers licence can be combined with other compatible applications in to a single multifunctional card.

Sample Drivers Licence Smart Card

Quick installation and no site set up cost

Simple to manage & even simpler to use

No PC or IT skills necessary

Return on Investment

Maintaining a good health & safety record means fewer insurance claims, potentially lower insurance premiums, increased productivity and efficiency and a better public reputation.

ACCESS CONTROL PLUS+ could save you thousands in damage costs, accident claims and reputation damage by preventing the unauthorised operation of materials handling vehicles and equipment, limiting potential accidents and damage to assets.

'Smart Access is the most secure form of vehicle access control, ensuring your drivers are truly accountable & unable to openly share PINs, unlike PIN Key Pad access modules.'

TRUCKLOG

ACCESS CONTROL PLUS+

THE SMART APPROACH TO SMALL FLEET SAFETY

- + Electronic drivers licence
- + Information at the press of a button
- + No PC or software

'We chose it (with shock sensing) because we needed to isolate trucks following a collision until such time the supervisor was able to inspect the vehicle, see who was driving, at what time, take action and then reset them'

ACCESS CONTROL PLUS+

The smarter way to make your materials handlers accountable!

Access Control PLUS+ has already demonstrated that access control systems genuinely do benefit small fleet users whom do not have the need for either a full fleet management information system, nor the budget or availability of a PC to devote to analysing data, making this a very competitively priced access control system that will still deliver added value by displaying the information required to aid a significant reduction in damage costs.

Typical users:

- retail/wholesale operations
- builders merchants
- manufacturing plants
- printers/publishers

Prevent unproductive absenteeism and accident investigation downtime
Identify training needs
Identify damage and maintain your vehicles
Comply with working time regulation

Fewer accidents
Prevent fines
Reduce insurance claims and legal costs
Potential cuts in premiums

'Any system that can help a business avoid fatalities & improve the wellbeing of our personnel and the general public has to be a good thing'
